

Neurons

John A. White
Dept. of Bioengineering
john.white@utah.edu

BE 6003

Fall 2008

What makes neurons different from cardiomyocytes?

- Morphological polarity
- Transport systems
- Shape and function of action potentials
- Neuronal firing patterns
- Different roles of Ca^{2+}
- Methods of propagation
- Mechanisms of synaptic transmission
- Mechanisms of intracellular integration
- Glial support systems
- Synaptic plasticity
- Homeostatic plasticity

BE 6003

Fall 2008

The father of modern neuroscience

Ramon y Cajal
1852-1934
Nobel prize 1906

Neuron doctrine: neurons are the basic structural and functional unit of the nervous system

<http://nobelprize.org>

BE 6003

Fall 2008

Morphological polarity

Ramon y Cajal
1852-1934

<http://nobelprize.org>

Law of dynamic polarization: nerve cells are *polarized*, receiving information on their cell bodies and dendrites, and conducting information to distant locations through axons

Berne and Levy

BE 6003

Fall 2008

Morphological polarity

Cajal's art

Cerebral cortex

Cerebellum

Optic tectum

BE 6003

Fall 2008

Transport systems

Microtubule-based transport

BE 6003

Salinas et al. (2008) *Curr Opin Cell Bio* 20: 445-453

Fall 2008

Neuronal action potentials are Na⁺ and K⁺ dominated

Berne and Levy

BE 6003

Fall 2008

Refractory periods are short

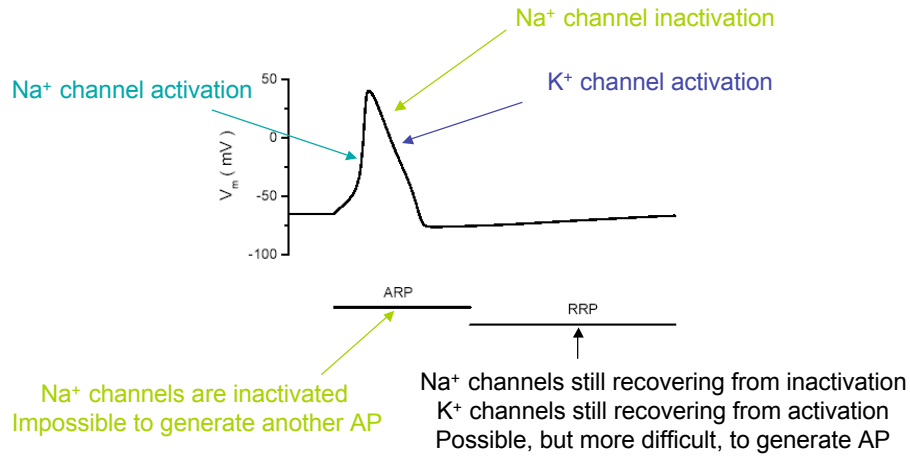

White (2000) *Encyclopedia of the Human Brain*

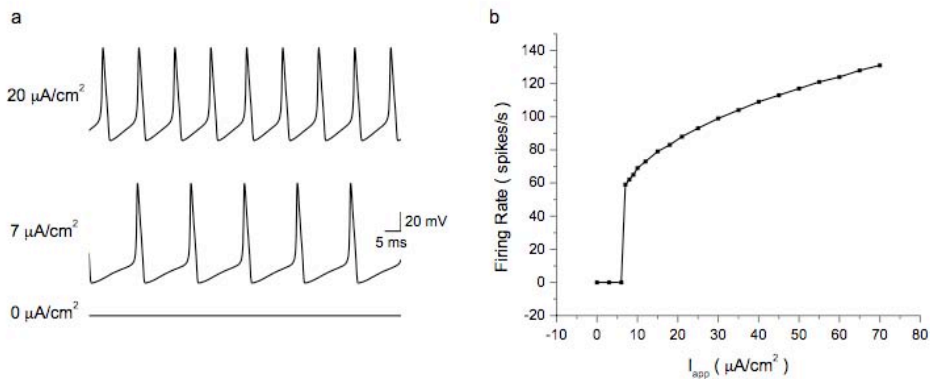

BE 6003

Fall 2008

Crucial features of the neuronal action potential

Neurons can fire at high rates

Neurons can fire at high rates

BE 6003

Colburn et al. (2003) *J Assoc Res Otol* 4: 294-311

Fall 2008

Spike-rate adaptation is very common in neurons

Dayan and Abbott, Fig. 5.6

BE 6003

Fall 2008

SK-type Ca^{2+} -activated K^+ channels often play a role in adaptation

Calmodulin-binding domain

Stocker (2004) *Nature Reviews Neuroscience* 5: 758-770

Neuronal calcium channels

Ancillary subunits
 $\beta_1, \beta_2, \beta_3, \beta_4$
 γ_1 through γ_8
 α_2 - δ_1 through α_2 - δ_4

Neuronal α_1 subunits

HVA $Ca_v1.2, Ca_v1.3, Ca_v1.4$ } L-type
 $Ca_v2.1, Ca_v2.2, Ca_v2.3$ } P/Q-type, N-type, R-type
LVA $Ca_v3.1, Ca_v3.2, Ca_v3.3$ } T-type

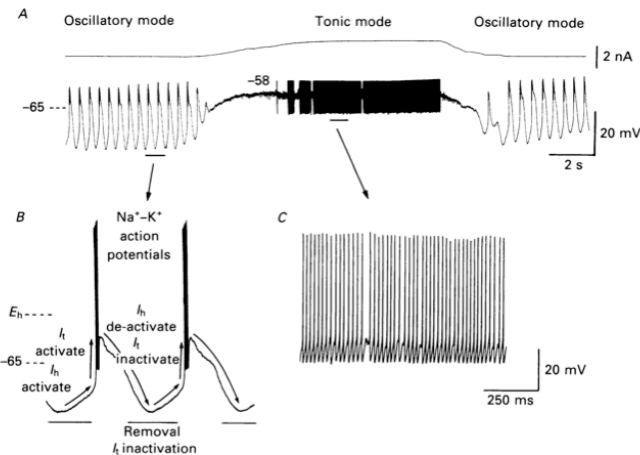

L: Slow, largely non-inactivating. Found in cell bodies, dendrites.

P/Q, N: Slowly inactivating, presynaptic terminals

R: More rapid inactivation than P/Q, N. Presynaptic terminals, proximal and distal dendrites.

T: Low-threshold, rapidly inactivating. Soma and (distal?) dendrites.

Multi-state activity in thalamocortical neurons

BE 6003

McCormick and Pape (1990) *J Physiol* 431: 291-318.

Fall 2008

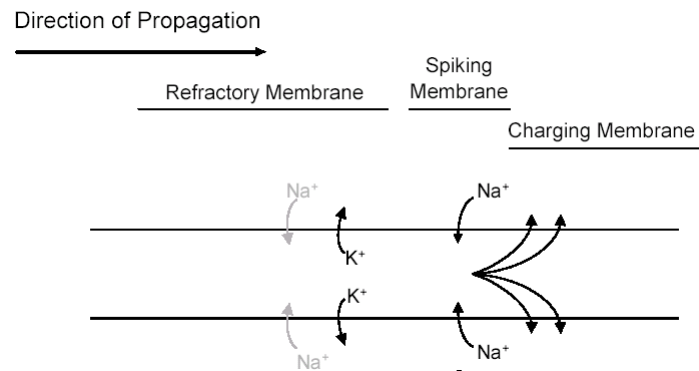

Major roles of Ca²⁺ in neurons

- Triggers spike-rate adaptation
- Involved in bursting
- Triggers exocytosis at chemical synapses
- Involved in dendritic processing
- Local signal for synaptic plasticity
- Control signal for cellular homeostasis

BE 6003

Fall 2008

Propagation in unmyelinated axons

Myelination of axons

Myelination of axons

BE 6003

Berne and Levy

Fall 2008

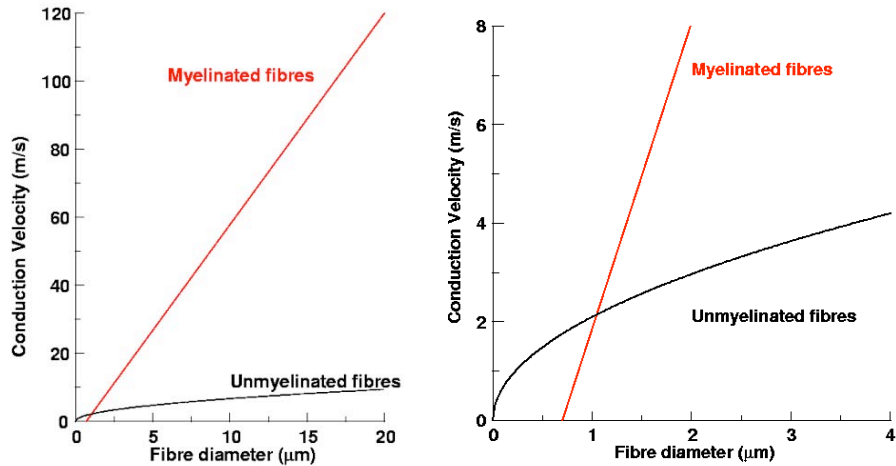

Propagation in myelinated axons

BE 6003

Fall 2008

Myelinated axons have higher conduction velocities

BE 6003

<http://www.physiol.usyd.edu.au/daved/teaching/cv.html>

Fall 2008

Electrical synapses

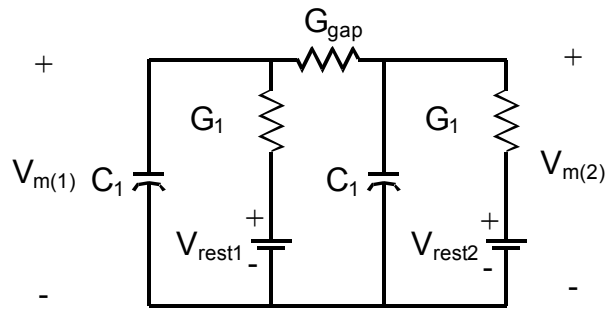

BE 6003

Berne and Levy

Fall 2008

Electrical synapses are resistive and bidirectional

Chemical synapses

Chemical synapses

- Immediately releasable pool: vesicles held close to plasma membrane by SNAREs
- Depolarization of presynaptic terminal
- Ca^{2+} entry
- Fusion
- Diffusion of neurotransmitter across cleft
- Binding to postsynaptic receptor
- Recycling of neurotransmitter

BE 6003

Berne and Levy

Fall 2008

Resupplying the immediately releasable pool

- Depol. of presyn. terminal
- Ca^{2+} entry
- Activation of CaMKII
- Phosphorylation of synapsin I
- Synapsin I frees vesicles
- SNAPS and SNAREs dock the vesicle

BE 6003

Berne and Levy

Fall 2008

Distinguishing features of chemical synapses

BE 6003

Fall 2008

Two distinct classes of chemical synaptic receptors

• Ionotropic

- Postsynaptic receptor is an ion channel
- Binding of ligand (neurotransmitter) changes P_{open}
- Fast, transient, small gain

• Metabotropic

- Postsynaptic receptor is tied to postsynaptic 2nd-messenger systems (usually G-protein-based)
- Slow, long-lasting, enormous gain

BE 6003

Fall 2008

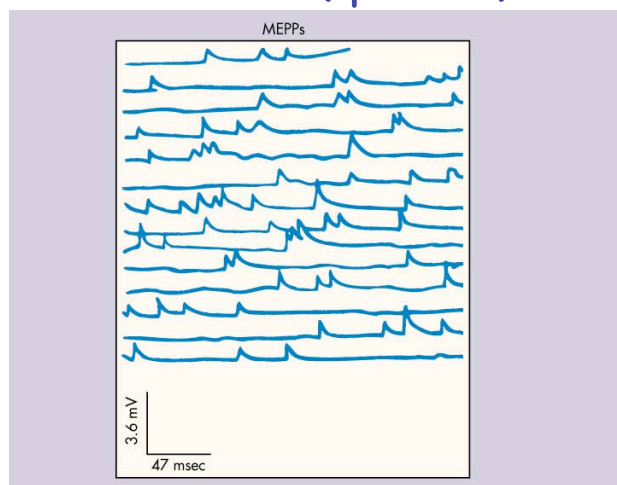

Major neurotransmitters and neuromodulators

- Amino acids
 - Glutamate
 - GABA (gamma aminobutyric acid)
 - Glycine
- Acetylcholine
- Catecholamines
 - Norepinephrine
 - Dopamine
 - Serotonin
- Peptides
 - Opioids (endorphins, enkephalins, dynorphins)
 - Substance P
- Gases
 - Nitric oxide
 - CO

BE 6003

Fall 2008

Spontaneous release of single vesicles (quanta)

BE 6003

Berne and Levy

Fall 2008

Ionotropic EPSPs and IPSPs

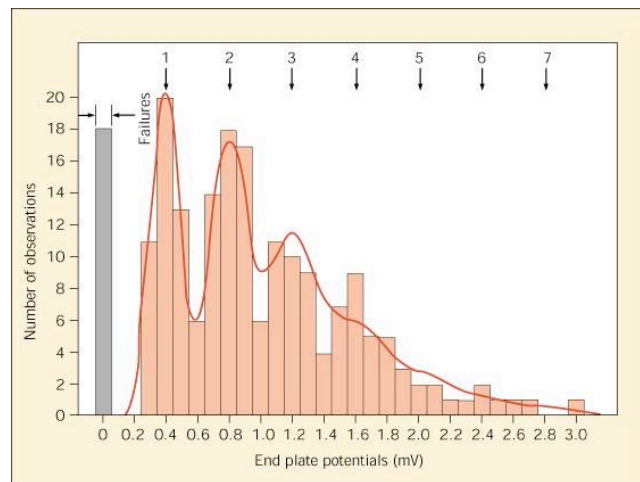

BE 6003

Berne and Levy

Fall 2008

Quantal release

BE 6003

Berne and Levy

Fall 2008

Binomial model

$$P(q = k) = \frac{N!}{k!(N - k)!} p^k (1 - p)^{n-k}$$

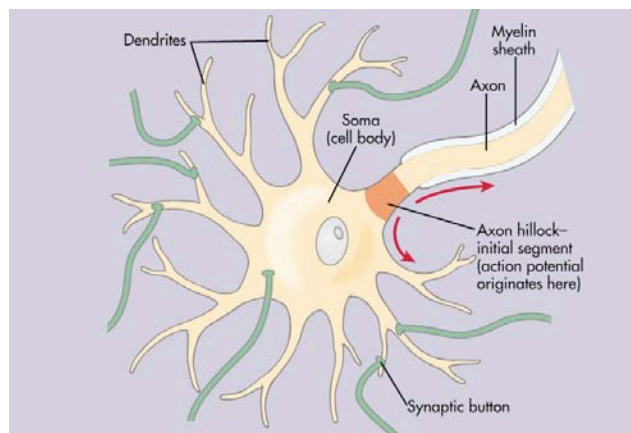

$$E[q] = Np$$

$$\sigma^2 = Np(1 - p)$$

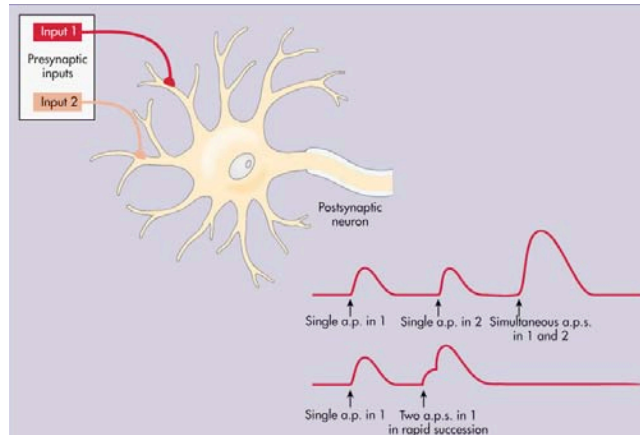

Classical model of neuronal integration of inputs

Excitatory inputs
tend to innervate
dendrites

Inhibitory inputs
tend to innervate
cell bodies

Spatial and temporal summation

Cable theory

$$2 \frac{\#^2 V_m}{\#x^2} = \# \frac{V_m}{\#t} + V_m(x,t) \% V_m^0$$

$$\lambda = \sqrt{\frac{a}{2\rho_i G_m}} \quad [=] \text{ mm}$$

$$\tau_M = C_m / G_m \quad [=] \text{ ms}$$

DC response of infinite cable

BE 6003

Fall 2008

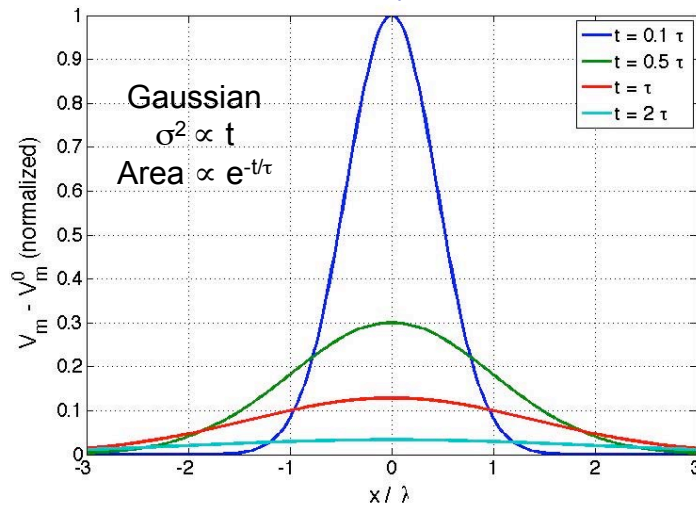

Impulse response of diffusion equation

BE 6003

Fall 2008

Impulse response of infinite cable

BE 6003

Fall 2008

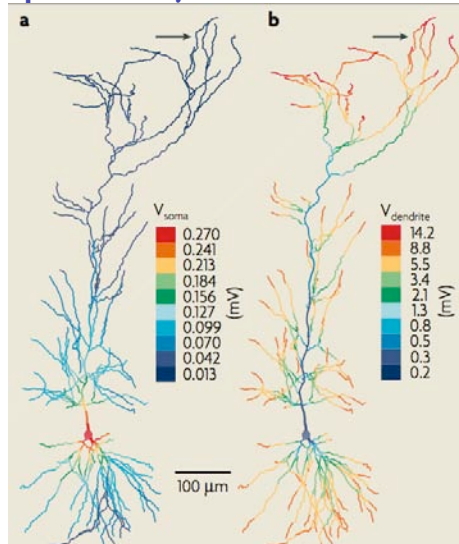

Impulse response of infinite cable

BE 6003

Fall 2008

Assuming linear (passive) cable properties, neurons are very "long"

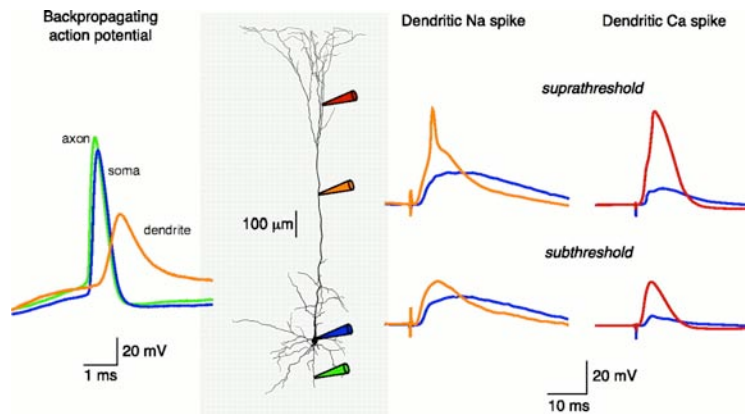

Spruston (2008) *Nature Rev Neurosci* 9: 206-221

BE 6003

Fall 2008

Dendrites are highly nonlinear

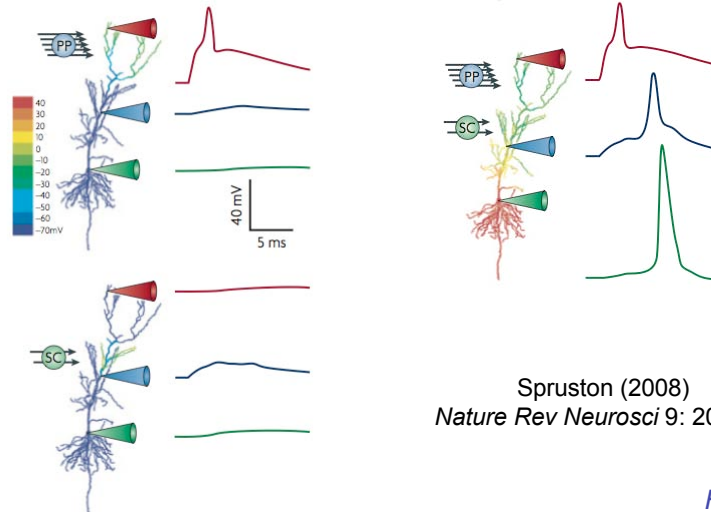

Häusser, Spruston, Stuart (2000) *Science* 290: 739-744

BE 6003

Fall 2008

Dendritic spikes may propagate only when coincident with more proximal inputs

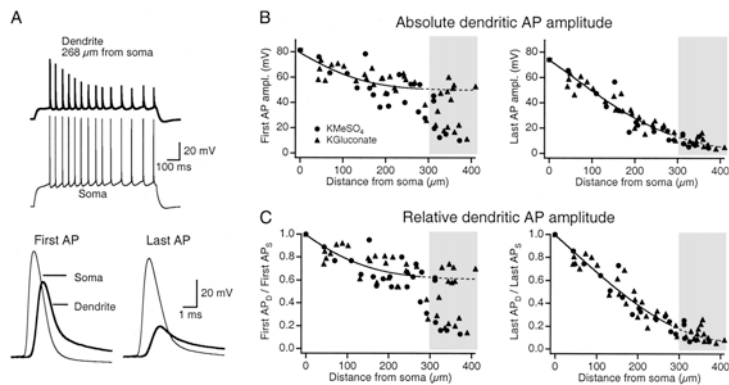

Spruston (2008)
Nature Rev Neurosci 9: 206-221

BE 6003

Fall 2008

Back-propagating APs

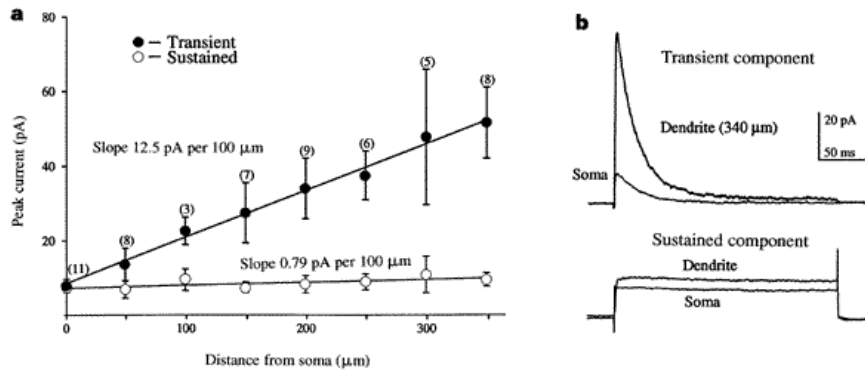

Golding et al. (2001) *J Neurophysiol* 86: 2998-3010

BE 6003

Fall 2008

K⁺ channel density grows with distance from the soma

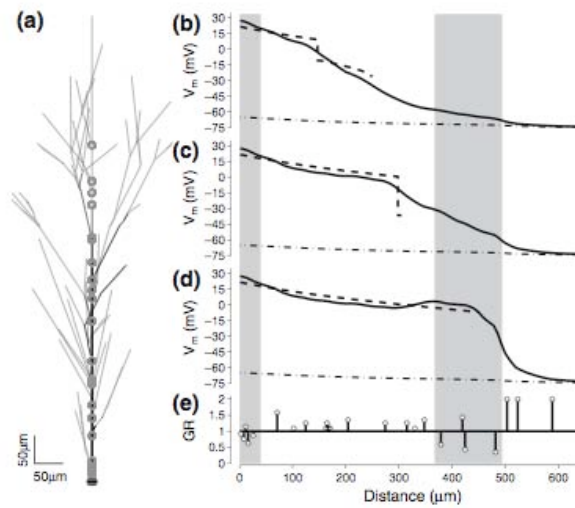

BE 6003
